The policyholder has one malting barley contract for delivery of 26,000 bushels of malting barley. The malting barley contract provides premium amount of minus \$1.50 per bushel.

Step 1: Multiply the planted acres intended to fulfill the contract by the approved APH yield by unit to determine the bushels per unit.

Unit 1: 55 bushels x 100 acres = 5,500 bushels
 Unit 2: 72 bushels x 200 acres = 14,400 bushels
 Unit 3: 60 bushels x 125 acres = 7,500 bushels
 Total: 27,400 bushels

Step 2: Determine the proration factor for each unit by dividing the bushels per unit by the total bushels determined in Step 1 (rounded to 6 decimal places).

Unit 1: $5,500/27,400 = 0.200730$
 Unit 2: $14,400/27,400 = 0.525547$
 Unit 3: $7,500/27,400 = 0.273723$

Note: If the total of these factors do not equal 1.000000, as shown in this example, adjust one or more of these factors so the total equals 1.000000.

Step 3: Prorate contracted bushels for each unit by multiplying the factor determined in Step 2 by the total contracted bushels.

Unit 1: $0.200730 \times 26,000 = 5,219$ bushels
Unit 2: $0.525547 \times 26,000 = 13,664$ bushels
Unit 3: $0.273723 \times 26,000 = 7,117$ bushels

Step 4: Determine the contracted acres by dividing by the APH yield.

Unit 1: $5,219/55 = 94.9$ acres
Unit 2: $13,664/72 = 189.8$ acres
Unit 3: $7,117/60 = 118.6$ acres

Step 5: Determine the non-contracted acres.

Unit 1: $100 - 94.9$ acres = 5.1 acres
Unit 2: $200 - 189.8$ acres = 10.2 acres
Unit 3: $125 - 118.6$ acres = 6.4 acres

The base price is not available by the acreage reporting date. The projected price for wheat (see section 10 of the MBE) is \$8.00 per bushel.

- The contract price for the contracted malting barley acreage is $\$8.00 + (-\$1.50) = \$6.50$ per bushel.
- The feed barley price is \$6.00 per bushel.

Step 6: Determine the weighted average projected price.

Unit 0001 (94.9 acres \times $\$6.50$ + 5.1 acres \times $\$6.00$) \div 100 acres = $(\$616.85 + \$30.60) \div 100$ acres = $\$6.47$ per bushel.

Unit 0002 (189.8 acres \times $\$6.50$ + 10.2 acres \times $\$6.00$) \div 200 acres = $(\$1,233.70 + \$61.20) \div 200$ acres = $\$6.47$ per bushel.

Unit 0003 (118.6 acres \times $\$6.50$ + 6.4 acres \times $\$6.00$) \div 125 acres = $(\$770.90 + \$38.40) \div 125$ acres = $\$6.47$ per bushel.

Step 7: Determine the initial revenue guarantee.

The policyholder chose revenue protection (RP) at the 70 percent coverage level. **The revenue guarantee by unit is:**

Unit 1: 55 bushels \times 0.70 \times $\$6.47$ \times 100 acres = $\$24,910$
Unit 2: 72 bushels \times 0.70 \times $\$6.47$ \times 200 acres = $\$65,218$
Unit 3: 60 bushels \times 0.70 \times $\$6.47$ \times 125 acres = $\$33,968$
Total: $\$124,096$

The harvest price for wheat (section 10 of the MBE) is \$9.00 per bushel. The harvest price for the policyholder's malting barley is determined as follows:

Unit 1: $\$6.44 - \$8.00 = \text{minus } \$1.53$
Unit 2: $\$6.47 - \$8.00 = \text{minus } \$1.53$
Unit 3: $\$6.47 - \$8.00 = \text{minus } \$1.53$

Unit 1: $\$9.00 - \$1.53 = \$7.47$ per bushel
Unit 2: $\$9.00 - \$1.53 = \$7.47$ per bushel
Unit 3: $\$9.00 - \$1.53 = \$7.47$ per bushel

Step 8: The price went up during the insurance period; therefore, the coverage goes up since the policyholder chose RP. **The revised revenue guarantees are:**

Unit 1: $55 \text{ bushels} \times 0.70 \times \text{max} (\$6.47 \text{ projected price, } \$7.47 \text{ harvest price}) \times 100 \text{ acres} \times 1.000 \text{ share} = \mathbf{\$28,760}$.
Unit 2: $72 \text{ bushels} \times 0.70 \times \text{max} (\$6.47 \text{ projected price, } \$7.47 \text{ harvest price}) \times 200 \text{ acres} \times 1.000 \text{ share} = \mathbf{\$75,298}$.
Unit 3: $60 \text{ bushels} \times 0.70 \times \text{max} (\$6.47 \text{ projected price, } \$7.47 \text{ harvest price}) \times 125 \text{ acres} \times 1.000 \text{ share} = \mathbf{\$39,218}$.

Total Revenue Guarantee all Units: $\$143,276$

Claim Example 1

Unit 0001

The revenue guarantee = $55 \text{ bushels} \times 0.70 \times \text{max} (\$6.47 \text{ projected price, } \$7.47 \text{ harvest price}) \times 100 \text{ acres} \times 1.000 \text{ share} = \mathbf{\$28,760}$.

5,000 bushels are produced in Unit 0001, all of which are rejected by the buyer and grade U.S No. 5.

The harvest price for barley according to the CEPP is $\$5.50$.

The adjusted quantity under the MBE is: $5,000 \text{ bushels} \times (\$5.50 \div \$7.47) = 3,681.4 \text{ bushels}$.

The adjusted quantity from the MBE is also then further adjusted for quality under the Small Grains Crop Provisions. The discount for the barley grading U.S. No. 5 from the quality statement in the Special Provisions is $(1 - 0.262)$.

$3,681.4 \text{ adjusted bushels under MBE} \times (1 - 0.262) = 2,716.9 \text{ bushels}$

To calculate an indemnity (following the steps specified in the Small Grains Crop Provisions):

- (1) The revenue guarantee is $\$28,760$;
- (2) $2,716.9 \text{ bushels} \times \$7.47 = \$20,295.24$;
- (3) The value of the production to count is $\$20,295.24$;
- (4) $\$28,760 - \$20,295.24 = \$8,464.76$; and

(5) $\$8,464.76 \times 1.000 \text{ share} = \mathbf{\$8,465}$ indemnity.

Note: The acres and production to put on next year's APH for Unit 0001 are 100 acres and 3,690 bushels.

$5,000 \text{ bushels} \times (1 - 0.262) = 3,690$ which includes only the quality adjustment in accordance with the Small Grains Crop Provisions.

Unit 0002

The revenue guarantee = $72 \text{ bu} \times 0.70 \times \max(\$6.47 \text{ projected price}, \$7.47 \text{ harvest price}) \times 200 \text{ acres} \times 1.000 \text{ share} = \mathbf{\$75,298}$.

12,000 bushels are produced in Unit 0002, all of which are rejected by the buyer.

The harvest price for barley according to the CEPP is \$5.50.

The adjusted quantity under the MBE is $12,000 \text{ bushels} \times (\$5.50 \div \$7.47) = 8,835.3 \text{ bushels}$.

To calculate an indemnity (following the steps specified in the Small Grains Crop Provisions):

- (1) The revenue guarantee is \$75,298;
- (2) $8,835.3 \text{ bushels} \times \$7.47 = \$65,999.69$;
- (3) The value of the production to count is \$65,999.69;
- (4) $\mathbf{\$75,298} - \$65,999.69 = \$9,298.31$ indemnity payable; and
- (5) $\$9,298.31 \times 1.000 \text{ share} = \mathbf{\$9,298}$ indemnity.

Note: The acres and production to put on next year's APH for Unit 0002 are 200 acres and 12,000 bushels.

Unit 0003

8,000 bushels are produced in Unit 0003, all of which are accepted by the buyer. The $8,000 \text{ bushels} \times \$7.47 \text{ harvest price}$ for the policyholder's malting barley = \$59,760. This is above the revenue guarantee (\$39,218) on the unit. Therefore, there is NO indemnity on Unit 0003.

Note: The acres and production to put on next year's APH for Unit 0003 are 125 acres and 8,000 bushels.

Claim Example 2

What if this policyholder had elected an enterprise unit on the farm in Claim Example 1? The total loss paid with 3 optional units is \$17,763.

Had this been insured with an enterprise unit versus optional units, the loss would be calculated as follows:

Total Revenue Guarantee = \$143,276

Production to count for loss determinations:

8,000 bushels accepted by buyer = 8,000

5000 rejected and grade US 5 = 2,716.9 adjusted bushels

12,000 rejected = 8,835.3 adjusted bushels

Weighted Average Projected Price:

Contracted Acres = 403.6 x \$6.50

Non-contracted Acres = 21.4 x \$6.00

$(\$2,623.4 + \$128.4)/425.0 = \$6.47$

The harvest price for wheat (section 10 of the MBE) is \$9.00 per bushel. The harvest price for the policyholder's malting barley is determined as follows:

$\$6.47 - \$8.00 = \text{minus } \$1.53$

$\$9.00 - \$1.53 = \$7.47$

Total = 19,552.2 total bushels x \$7.47 = \$146,054 which exceeds the revenue guarantee and no loss.

Note: If the insured had databases established for optional units and did not commingle the production, the acres and production to put on next year's APH are:

- **Unit 0001 - 100 acres and 3,690 bushels.**
- **Unit 0002 - 200 acres and 12,000 bushels.**
- **Unit 0003 - 125 acres and 8,000 bushels.**
